

# **SOLARIS SYSTEM ADMINISTRATION**

## **FIVE DAYS**

### ***Description***

The Solaris system administrator is crucial to maintaining the security and integrity of a Solaris system, whether it is “stand-alone” or (increasingly) connected to a network. This course covers the commands, files, and directories necessary to perform effective administration of any Solaris system.

### ***Objectives***

At the completion of this course, the student will be able to:

- Control user access
- Monitor performance of a Cf system
- Interface with vendors
- Update system software and hardware

### ***Topics***

- Introduction to Solaris system administration
- Controlling commands
- Korn shell
- Important directories and files
- Adding and removing users
- Stopping and starting the system
- Solaris file system structure
- Solaris file system maintenance
- Communications with users
- Monitoring system performance
- Configuring the system
- Networking software

### ***Audience***

This course is designed for those who have an intermediate to advanced knowledge of Solaris.

### ***Prerequisites***

The student should have six months of hands-on experience writing shell scripts and either one year of hands-on Solaris experience or the student should have taken a UNIX course and have six months of hands-on Solaris experience.
